

BIOLAKE

Enzyme complex for countering
eutrophication in lake and river waters

CHARACTERISTICS

Biolake is a mixture of thermostable catalytic enzymes associated with facultative bacteria, which ensures water treatment in natural and artificial lakes, such as in cases of stagnation or poor water circulation.

ADVANTAGES

- Enables the rapid decomposition of organic matter in suspension or deposited at the bottom of water supply lakes, thanks to a specific pool of enzymes and bacteria
- It clarifies surface water, allowing for the resumption of photosynthesis at deeper levels of the lake environment and an increased concentration of O₂ in deep-water layers
- Free from hazardous chemicals, algaecides and pesticides
- Harmless to plants and fish, promotes vigour of the lake flora and fauna
- Counteracts the formation of unpleasant odours from foam or algae.

DOSAGE

E.g.: 1,000 m³ lake.

	Trattamento d'urto	Trattamento di mantenimento
Acqua con 1 ricambio/sett	2 kg	1 kg/settimana
Acqua con 1 ricambio/giorno	4 kg	1 kg/settimana

Apply one or more bags of BIOLAKE directly into the lake. After an initial intensive treatment, it is recommended to continue with a weekly maintenance dose.

PACKAGING AND STORAGE

25 kg drums.

Store in a cool, dry place, away from sources of heat.
